

across channels and devices including WhatsApp, e-mails, etc. They had separate applications for every channel leading to a mesh of applications without any central hub, resulting in a broken experience for the customers, loss of time, resources and opportunities and data security threats. This is where we step in as a provider of a central communications hub to unburden our client's problems.

What efforts do you invest towards enhancing client experience?

The solutions that we have developed have been co-created with our clients. They operate both on their own data centres as well as on their private cloud. Our objective is two-fold. One, sharpen the experience of their customers by trying to ensure that communications are as omnichannel, and as real-time as possible. Second, our long-term vision is to be the strategic partner to our clients to help them grow their revenue through our solutions. If we succeed in leveraging the huge amount of data that our BSFI clients have, we can create a huge amount of value addition for them by giving insights that the clients do not know exist.

What is the gap that still exists out there which you want to venture into?

Despite our chequered history, we are still a very young and dynamic organization. There is a veritable mine of opportunities out there to explore and we have just scratched the surface! Our print and mail business was confining us within the India market, but after going digital and evolving the product, geographical boundaries are no more a limiting factor. We have already started operating in foreign markets like the Middle East (Qatar and the UAE), the US, and Hong Kong. The engagements are small as of now. As our product matures, we see ourselves grow in a lot of other global markets.

How are you leveraging AI technology to excel in product development?

It's a road map that we have embarked

upon. The kind of data that touches our platform is so granular in nature and if we are able to use AI well, the solutions that we are building will be able to predict a lot of useful outcomes for our business and our clients. AI is able to churn huge data and sift information showing us a predictive behavioural pattern/road map of an end customer of a financial institution. This will enable them to recommend new products and services in a hyper-personalised manner replacing the one-size-fits-all approach.. We are laying much emphasis on data science and AI, which will play an impactful role in our business in the times to come and is here to stay.

What do you envision with the great digital churn happening in India in terms of strengthening the economy?

As the digital penetration in the country grows, consumers will continue to expect better digital experiences. Today, their expectations are shaped by the new-age digital platforms, like Amazon, Facebook, Spotify, Snapchat, etc.; and they demand similar experiences from financial institutions.

Experience drives trust and loyalty. A robust CCM solution helps financial institutions inform, engage, and educate their customers based on their needs and choices by leveraging data. This relatable (hyper-personalized) experience will encourage them to save, borrow, insure, and invest more and better with their banks and insurers. Which will at once positively influence their financial behaviour as well as benefit the institutions. Thus, CCM has a great role to play in enhancing the country's financial inclusion.

What is the scope of CCM panning out in the next couple of years?

Customer Communications is the backbone of customer experience. The buzz around customer experience started in India only a decade ago and until then it was a sub-optimum experience that they were compelled to put up with. With changing customer expectations, BFSI

sector has just started playing the catch-up game.

Data is the new oil. The future of CCM lies in effective mining of data. If we develop good products and help financial institutions deliver tangible value for their customers, there will be many takers of our products which can take us across geographies.

It's exciting time for us to be in this unique business and for us being in India building a business like this. BSFI's are more robust abroad but on the tech side of things India has the upper hand.

What role can the government play in terms of ease-of-doing business for CCM companies?

Currently, the bulk of our business is in the private sector, but there is huge business potential in the public sector banks, and insurance companies where the government can proactively involve companies like FCI in policy making that supports and would enhance more inclusion in the entire gamut of CCM companies, BFSI and end customers. We recently bagged a project of a leading public sector Insurance company. Our aspirations too have grown markedly, which looks at the world as a large arena to explore and play. Our focus is to become globally the number one!

With your business growing manifold, what are FCI's expansion plans in terms of infra?

We already have facilities for physical print and mail in Gurugram, Navi Mumbai, Chennai and Kolkata, but our flagship Noida-based company office is mainly for the tech side of our business. As we have outgrown our Noida office, a 150-seat newly constructed office has been built on our Navi Mumbai premises. We also have office space in Vikhroli, Mumbai. We are looking at a two-location split between Mumbai and Delhi-NCR. As all our customers are based out of Mumbai, it will be a marketing and client interaction centre, while Delhi-NCR headquarter will be the strategic innovation centre.
